

Chapter 8 Lesson 5 Solve Problems Using Equations

Answers

1. The other possible rectangles are $2 \text{ m} \times 48 \text{ m}$, $3 \text{ m} \times 32 \text{ m}$, and $4 \text{ m} \times 24 \text{ m}$ because the product of each is also 96 m^2 .
2. The equation allowed Kurt to find the missing dimension, given that he already knew the area and the other dimension.
3. The area of the bigger tree is $(200 \text{ cm} \times 300 \text{ cm}) \div 2 = 60\,000 \text{ cm}^2 \div 2 = 30\,000 \text{ cm}^2$, so the two smaller trees will have an area of $30\,000 \div 2 = 15\,000 \text{ cm}^2$ each. The base and height of the smaller trees could be 100 cm and 300 cm , since $(100 \times 300) \div 2 = 15\,000$.
4. 0.35 m^2 is $0.35 \times 10\,000$ or 3500 cm^2 . The equation to find the length is, therefore, $50 \times \square = 3500$. Since $50 \times 70 = 3500$, the length must be 70 cm .
5. For example: The area of the first parallelogram is $10 \text{ cm} \times 5 \text{ cm} = 50 \text{ cm}^2$, so the area of the new one must be $50 \text{ cm}^2 \times 2 = 100 \text{ cm}^2$. Two possibilities for its base and height might be $10 \times 10 = 100 \text{ cm}^2$ and $20 \times 5 = 100 \text{ cm}^2$.
6. For example: The area of the family rink is $6 \text{ m} \times 7 \text{ m} = 42 \text{ m}^2$, so the school rink will have an area of $4 \times 42 = 168 \text{ m}^2$. Three possible dimensions for this rink would be $6 \times 28 \text{ m}$, $7 \text{ m} \times 24 \text{ m}$, and $12 \text{ m} \times 14 \text{ m}$. I would choose the last one because the others are too long and narrow.
8. $(\square \times 2) + 10 = 992$; $\square \times 2 = 982$; $982 \div 2 = 491$ cards
8. For example: The kitchen has an area of $144 - 120 = 24 \text{ m}^2$, so its dimensions could be $4 \text{ m} \times 6 \text{ m}$ or $3 \text{ m} \times 8 \text{ m}$.
